PBR Implementation and Review Process

Review, Assessment, and Improvement

Cande Olsen,
Vice President, Life Practice Council
American Academy of Actuaries

August 12, 2012
Why Do We Need PBR?

- Addresses shortcomings in current Formula-Based Reserve Methodology
  - Reserve methodology fundamentally unchanged for 150 years
  - Increased complexity in product design not easily addressed through new regulations or actuarial guidelines
  - “One size fits all companies and products” does not work
  - Reserve may be too conservative or not adequate for some products and benefits
PBR Represents a Major Paradigm Shift

- From a strictly formulaic basis (static)
- To requirements that include elements of stochastic modeling (i.e., using a range of economic scenarios) and an insurer's own experience (dynamic)
- There are benefits to consumers, regulators, and the industry, but the transition has its challenges
- And both the transition elements and the dynamic methodology itself require continuous review, assessment and improvement
Introduction of Prescriptive and Limiting Elements

- There was some concern expressed by regulators with the model-based approach and the degree of discretion provided to companies in establishing reserves.
- Prescriptive and limiting elements were introduced to address those concerns.
- The Life Practice Council (LPC) understands that there are regulatory concerns about transitioning to a PBR framework.
Risk of Prescriptive and Limiting Elements

- Many of these prescriptive and limiting elements:
  - May add significant, unnecessary complexity
  - May add excessive conservatism not needed in a fully mature PBR system.
  - May cause regulatory valuation to diverge from the processes used by insurers in managing their risks at an enterprise level
Need for a Process to Review Prescriptive and Limiting Elements

- It is critical to the success of PBR to develop a process by which the impact of these added elements can be evaluated and either adjusted or removed once actuarial practice is demonstrated to be established and regulators become comfortable with company filings.

- The result will be a more purely stochastic-based, experience-based PBR framework that appropriately reflects individual company risk and experience.
Need for a Process to Review Stochastic Modeling

- In order for a stochastic model to be an effective analytical tool:
  - The model’s calculation routines, such as its interest rate generator, must be calibrated to be consistent with updated data and must be evaluated for reasonableness.
  - The assumptions used in the model must reflect recent experience. A process to review the assumption-setting and modeling process is needed to ensure that it is up-to-date and is a necessary complement to a valuation method that incorporates stochastic modeling.
Challenges to Obtain and Retain Resources

At State Insurance Departments

- Need to develop the expertise necessary to analyze complex stochastic models
- Need new tools to evaluate complex models, and a cohesive and objective framework for evaluating the adequacy of reserves if/when changes are needed.
- May need additional personnel with expertise to make improvements to the PBR framework once sufficient experience exists.

At the NAIC

- The many competing priorities (e.g., SMI, PBR for other lines of business, RBC), will create a demanding environment for finding and retaining dedicated working group and staff resources to undertake such a review process.
Challenges to Obtain and Retain Resources (cont.)

- From the Academy, SOA, Industry and other interested parties
  - Efforts are necessary to the success of PBR
  - Maintenance of robust experience studies and documentation will be essential

- This paradigm shift in valuation requires actuarial input from all involved (companies, regulators, etc.) to evaluate the effectiveness of the overall valuation approach
Possible Ways to Address Resource Challenges

- A Centralized Review Facility
  - Could be staffed by actuaries employed by the NAIC or contracted through consulting firms
  - Would provide knowledgeable and dedicated resources to support state insurance departments as they review companies’ reserves using principle-based approaches
  - Could be used as a resource to the NAIC in its role in evaluating the overall effectiveness of PBR for the industry at large

- Additional actuarial resources at individual state insurance departments

- The NAIC should act now to determine the most effective means for ensuring the necessary tools and resources are in place to review, assess and improve this new dynamic approach to valuation
Summary

- The LPC supports the adoption of the PBR methodology in the Standard Valuation Law and the Valuation Manual (VM)

- However, it would not be prudent or responsible to establish a stochastic valuation requirement without also establishing a process that facilitates the ongoing review, assessment, and improvement of such dynamic methodology

- The LPC stands ready to assist the NAIC in this effort
